Dermatomyositis Diagnosis Criteria

Patient Information
Patient Name:
Assigned Healthcare Practitioner:
Skin Symptoms
☐ Heliotrope rash
☐ Periungual telangiectasias
☐ Gottron's sign or papules
☐ Shawl sign, V-sign, and holster sign
Skin biopsy demonstrating reduced capillary density and deposits of membrane attack complex on small blood vessels along the dermal-epidermal junction and within the walls of dermal blood vessels
Additional Criteria
Additional Criteria Symmetrical muscle weakness in shoulders/upper arms or hips/upper legs and trunk
☐ Symmetrical muscle weakness in shoulders/upper arms or hips/upper legs and trunk ☐ Elevation of serum levels of skeletal muscle-associated enzymes: CK, aldolase, LD,
□ Symmetrical muscle weakness in shoulders/upper arms or hips/upper legs and trunk □ Elevation of serum levels of skeletal muscle-associated enzymes: CK, aldolase, LD, transaminases
 Symmetrical muscle weakness in shoulders/upper arms or hips/upper legs and trunk Elevation of serum levels of skeletal muscle-associated enzymes: CK, aldolase, LD, transaminases Muscle pain on grasping or spontaneous pain EMG showing short, small, low-amplitude polyphasic motor unit potentials, fibrillation potentials,
 Symmetrical muscle weakness in shoulders/upper arms or hips/upper legs and trunk Elevation of serum levels of skeletal muscle-associated enzymes: CK, aldolase, LD, transaminases Muscle pain on grasping or spontaneous pain EMG showing short, small, low-amplitude polyphasic motor unit potentials, fibrillation potentials, and bizarre high-frequency repetitive discharges
 Symmetrical muscle weakness in shoulders/upper arms or hips/upper legs and trunk Elevation of serum levels of skeletal muscle-associated enzymes: CK, aldolase, LD, transaminases Muscle pain on grasping or spontaneous pain EMG showing short, small, low-amplitude polyphasic motor unit potentials, fibrillation potentials, and bizarre high-frequency repetitive discharges Positive for myositis-specific autoantibodies

Note: Amyopathic dermatomyositis (dermatomyositis without muscle pain and weakness) has unique diagnostic considerations.
