

Diplopia Test (Red Glass Test)

Name	Date
Date of birth	Gender
Contact details	
Materials needed	
<ul style="list-style-type: none">• Red lens or red filter (can be red cellophane, red transparency film, red-tinted glasses)• Visual target (letter, word, or object to focus on)	
Instructions	
<ol style="list-style-type: none">1. Ensure the examination room has appropriate lighting for clear vision.2. Inform the patient about the procedure and its purpose in evaluating double vision.3. Seat the patient comfortably at an appropriate distance from the visual targets.4. Hand the red lens or red filter to the patient and ask them to cover one eye while looking at the visual targets with the uncovered eye.5. Instruct the patient to concentrate on the visual targets provided (e.g., letters on a chart, words, or objects) with the uncovered eye.6. As the patient focuses on the visual targets, observe if there are any additional images or ghosting seen through the red lens by the covered eye.7. Take note of any separation or misalignment in the images.8. Instruct the patient to cover the opposite eye and repeat the process of focusing on the visual targets with the other eye while using the red lens.9. Document any observed double vision or multiple images, noting the direction and extent of separation, if present.10. Consider conducting additional eye examinations or tests as clinically indicated if double vision or abnormalities are observed.	
Findings
