DSM-5 Autism Checklist

Name:

Date:

Age:

Gender:

Clinician:

A. Persistent deficits in social communication and social interaction across multiple contexts, as manifested by the following, currently or by history

- □ A1. Deficits in social-emotional reciprocity, ranging, for example, from abnormal social approach and failure of normal back- and- forth conversation; to reduced sharing of interests, emotions, or affect; to failure to initiate or respond to social interactions
- A2. Deficits in nonverbal communicative behaviors used for social interaction, ranging, for example, from poorly integrated verbal and nonverbal communication; to abnormalities in eye contact and body language or deficits in understanding and use of gestures; to a total lack of facial expressions and nonverbal communication.
- ☐ A3. Deficits in developing, maintaining, and understanding relationships, ranging, for example, from difficulties adjusting behavior to suit various social contexts; to difficulties in sharing imaginative play or in making friends; to absences of interest in peers.

B. Restricted, repetitive patterns of behavior, interests, or activities as manifested by at least 2 of 4 symptoms currently or by history

- □ B1. Stereotyped or repetitive motor movements, use of objects, or speech (e.g., simple motor stereotypies, lining up toys or flipping objects, echolalia, idiosyncratic phrases).
- □ B2. Insistence on sameness, inflexible adherence to routines, or ritualized patterns of verbal or nonverbal behavior (e.g. extreme distress at small changes, difficulties with transitions, rigid thinking patterns, greeting rituals, need to take same route or eat same food everyday).
- B3. Highly restricted, fixated interests that are abnormal in intensity or focus (e.g., strong attachment to or preoccupation with unusual objects, excessively circumscribed or preservative interest).
- B4. Hyper- or hyporeactivity to sensory input or unusual interest in sensory aspects of the environment (e.g., apparent indifference to pain/temperature, adverse response to specific sounds or textures, excessive smelling or touching of objects, visual fascination with lights or movement)

C. Symptoms must be present in the early developmental periods (but may not become fully manifest until social demands exceed limited capacities, or may be masked by learned strategies in later life)

D. Symptoms cause clinically significant impairment in social, occupational, or other important areas of current functioning. (minimum = level 1)

_____ Social Communication Severity Level (1, 2, or 3)

____ Restricted Repetitive Behavior Severity Level (1, 2, or 3)

E. These disturbances are not better explained by intellectual disability (intellectual development disorder) or global developmental delay.

Specify if:

- □ With or without accompanying intellectual impairment
- □ With or without accompanying language impairment
- □ Associated with another neurodevelopmental, mental, or behavioral disorder
- □ Associated with a known medical or genetic condition or environmental factor
- □ With catatonia

Severity Level for ASD	Social Communication	Restricted Interests & Repetitive Behaviors
Level 3 'Requiring very substantial support'	Severe deficits in verbal and nonverbal social communication skills cause severe impairments in functioning, very limited initiation of social interactions, and minimal response to social overtures from others. For example, a person with few words of intelligible speech who rarely initiates interaction and, when he or she does, makes unusual approaches to meet needs only and responds to only very direct social approaches.	Inflexibility of behavior, extreme difficulty coping with change, or other restricted/repetitive behaviors markedly interfere with functioning inall spheres. Great distress/difficulty changing focus or action.
Level 2 'Requiring substantial support'	Marked deficits in verbal and nonverbal social communication skills; social impairments apparent even with supports in place; limited initiation of social interactions; and reduced or abnormal response to social overtures from others. For example, a person who speaks simple sentences, whose interaction is limited to narrow special interest, andwho has markedly odd nonverbal communication.	Inflexibility of behavior, difficulty coping with change, or other restricted/ repetitive behaviors appear frequently enough to be obvious to the casual observer and interfere with functioning in a variety of contexts. Distress and/or difficulty changing focus or action

Level 1	Without supports in place, deficits	Inflexibility of behavior causes
'Requiring	in social communication cause	significant interference with
support'	noticeable impairments. Difficulty	functioning in one or more
	initiating social interactions, and	contexts. Difficulty switching
	clear examples of atypical or	between activities. Problems of
	unsuccessful response to social	organization and planning
	overtures of others. May appear	hamper independence.
	to have decreased interest in	
	social interactions. For example,	
	a person who is able to speak in	
	full sentences and engages in	
	communication but whose to-and-	
	fro conversation with others fails,	
	and whose attempts to make	
	friends are odd and typically	
	unsuccessful
