

Ortolani Test

Patient Information

Name of Patient: Tammy Carter

Date of Birth: April 2, 2023

Name of Caretaker: Tanya Carter

Date of Exam: April 26, 2024

Examiner: Dr. Lisa Grant

Consent

I, _____ Tanya Carter _____, consent to the Ortolani Test being performed on _____ Tammy Carter _____ and understand the nature and purpose of the test.

Signature:

Pre-test Checklist

- Barlow Test performed
- Patient is relaxed and in a supine position
- Hips and knees are flexed at 90 degrees

Ortolani Test Procedure

1. Ensure the infant is supine with hips and knees flexed at 90 degrees.
2. Grasp the infant's legs with your fingers positioned over the lesser trochanter.
3. Slowly abduct the hips while applying gentle pressure upward toward the greater trochanter, aiming to relocate the dislocated femoral head into the acetabulum.

Test Findings

Click or clunk felt (positive Ortolani sign)

No sound or resistance (negative Ortolani sign)

Other observations and additional notes regarding procedure:

Significant clunk was noticed as the hip was repositioned, consistent with a positive Ortolani sign, indicating potential hip dysplasia.

Examiner's Additional Notes

Input any notes for the caretaker or other members of the care team here.

Tammy showed signs of mild discomfort during the procedure, but no distress. Immediate orthopedic consultation recommended to evaluate the need for intervention such as harnessing.
